SUMMARY

Full-stack software engineer building production web applications since 2023 across C#/.NET, Node.js, and React/TypeScript. Builds and secures RESTful APIs backed by SQL Server, PostgreSQL (Supabase), and Firebase, delivers through feature-branch and peer-reviewed pull request workflows in Azure DevOps, and traces production bugs to root cause. Works in Agile teams with product and design. Placed 2nd at the Method hackathon with Recoverly, a supplier chargeback-recovery app built on Home Depot associate research I conducted.

SKILLS

- **Backend & APIs:** C#, .NET Core, ASP.NET, Node.js, RESTful API design, Entity Framework, ADO.NET, authentication/authorization (Firebase OAuth, role-based access)
- **Databases:** SQL Server (T-SQL, stored procedures), PostgreSQL (Supabase), Firebase/Firestore, MongoDB (Associate certified)
- **Cloud & DevOps:** Google Cloud (via Firebase: Auth, Firestore, Cloud Functions), Azure DevOps (Repos, pull requests), Git/GitHub, Vercel
- **Front End:** React, TypeScript, JavaScript, Next.js, TanStack Start, Tailwind CSS, MUI, Formik/Yup
- **Practices:** Agile/Scrum, OOP, debugging and root cause analysis, code review, schema validation

EXPERIENCE

Software Developer | TopSpin Max | 06/2025 – 12/2025

- Built the Gear history feature in React from Figma designs: refactored the existing stepper to reduce its code and improve readability, and built a reusable, user-customizable form with schema validation enforcing required data, plus a reusable table component
- Reproduced and resolved 3 production bugs in tournaments, tracing root causes to API responses and verifying fixes through manual testing before release.
- Integrated tournament location data through Supabase (Postgres) APIs, connecting the React front end to 4 queries/endpoints, and managed staging-to-production merges to ship 2 releases.

Software Developer Intern | Cloudfit Software | 06/2025 – 08/2025

- Migrated 10 components from Ant Design to MUI by driving a component builder in one repo via terminal command line and validating the generated output in a second repo, learning the workflow from scratch via wikis and manual investigation.
- Connected the React front end to local SQL Server tables through Entity Framework in an isolated, non-production environment, hydrating migrated MUI components with real data to verify that affected schemas/views rendered correctly after the Ant Design migration.
- Delivered the Ant Design to MUI migration on isolated feature branches in Azure DevOps Repos, with every pull request peer-reviewed before merging to main, across 4 PRs.
- Presented migration findings in weekly stakeholder demos, incorporating feedback to adjust goals and priorities, and worked with a Senior Software Engineer who guided technical direction and reviewed pull requests.
- Met weekly with a project manager mentor to prioritize tasks and plan my time across internship goals, building habits for scoping work and managing competing priorities in a DoD contractor environment.

Software Engineer Resident | Method | 06/2024 – 07/2024

- Co-built an MVP from scratch on one of three engineering teams (2-3 engineers each), helping select the tech stack (Next.js, Firebase, Chart.js) and delivering the app to stakeholders in 2 weeks from finalized designs.
- Owned application development outside of DevOps: built Firebase cloud functions (HTTP triggers) for reading and writing 3 collections, plus a reusable dropdown component and metric-based leaderboard pages, including an experience-points view in Chart.js.
- Collaborated with 2 Product Managers and 2 UI Designers on UX/UI processes (user interviews, feature prioritization, and finalization) for login, navigation bar, dashboard, and leaderboard pages.
- Completed a residency at a technology consultancy, with weekly mentorship and training in consulting delivery alongside hands-on MVP development.

Fullstack Software Engineer (Contract, Sabio Cohort) | Resolvely.AI | 10/2023 – 03/2024

- Joined a cohort team that shrank from 18 to 12 engineers to finish a college-transition web platform for admins and high school seniors, started by a prior cohort, and delivered it to completion.
- Built the success story workflow end to end: student profile and story submission forms, the admin review interface, and an admin-triggered .NET email flow (PUT endpoint, controller, model, and service methods) that sends students a templated Brevo email when their story is approved or denied, behind an interface abstraction so the email provider can be swapped without touching business logic.
- Connected React views and Formik forms through Axios to .NET APIs calling SQL Server stored procedures (ADO.NET), validating each request with Yup schemas (min/max length rules) and C# checks so payloads match the backend model and SQL table definitions before reaching the database.
- Took over the comment section after its original engineer left and connected it to the events page, so users viewing an event card can leave real-time comments on that specific card.

PROJECTS

Recoverly | Method Hackathon, 2nd Place & Most Unique Concept | 10/2026 https://retailer-resolve.vercel.app/

- Placed 2nd and won Most Unique Concept in a week-long Method hackathon on a team of 4, building Recoverly, a supplier-side app that helps analysts dispute invalid retailer chargebacks (Walmart, Amazon) with a rules-based readiness score and deadline alerts.
- Ran the Home Depot associate interview and supplier research behind the product, including the finding that every document for a purchase order should live in one case timeline, which became the app's core design. Judges recognized the concept as unique given how few supplier-side software examples exist, and credited the depth of research completed in one week.
- Served as Research & Software Engineer, setting up the prototype structure and deploying it to Vercel (TanStack Start, Supabase, TypeScript, Tailwind), with mentorship from a Method Associate Director / Senior Software Engineer.

Mi Casita | Personal Full-Stack Project github.com/guadalupejara/mi_casita

- Built a centralized home-organization dashboard (calendar, sticky notes, reminders, lists, messaging) using React, Next.js, and Tailwind CSS, with Firebase for the backend and authentication.
- Secured the app with Firebase OAuth (login/logout, profile updates, secure account deletion) and role-based routing between public and authenticated pages.
- Enforced clean user data with Yup and Formik schema validation, including a settings form that pre-populates and updates user data in real time.
- Persisted draggable, real-time sticky notes with customizable fonts and colors to the database.

Echos | Personal Full-Stack Project https://echos-alpha.vercel.app/

- Built and deployed a private, distraction-free writing app with React, Tailwind CSS, and Vite.
- Added customizable UI themes (background, font, color) through controlled dropdown state, plus a local save that exports reflections as a .txt file.

EDUCATION

Full Stack Engineer Certification, Sabio Enterprises Bootcamp	03/2024
Master of Arts, University of Roehampton	06/2019
B.A. & B.S., University of California, Riverside	06/2016

CERTIFICATIONS

MongoDB Associate	07/2024
Google — UX Design Specialization	01/2023
